Evaluation Subjects	Level 4 - Excellent	Level 3 - Good	Level 2 - Developing	Level 1 - Limited
Functionality and Completeness (30%)	A non-trivial pipeline is implemented and functions correctly throughout.	The major components of the pipeline are present and generally functional. Some errors or omissions are present, but the overall approach remains mostly operational.	Only a partial pipeline is implemented. Significant errors or missing components are present. Substantial modification would be required to obtain the indented results.	The pipeline is largely incomplete, non-functional, or completely missing. Major components are incorrectly implemented, or insufficient work is submitted to demonstrate a working approach.
Data Preparation and Model Training (20%)	Data are properly prepared and preprocessed. The ML model is correctly trained using suitable features and target data.	Data preparation and preprocessing are mostly correct, with some minor bugs or moderate issues affecting the results. The ML model is correctly trained to produce reasonable results.	Significant problems exist in data preparation and preprocessing. The ML model is trained incorrectly, and the training loop requires significant modification or improvement to produce desired results.	Data are processed incorrectly, not processed at all, or the wrong data are used for the pipeline. Major errors present for model training, or the model has not been trained.
Model Performance and Results (20%)	The trained model performs reasonably well on the test data. Results are internally consistent within the implemented pipeline.	Predictions and evaluation of the ML models are mostly correct, though some errors or omissions might be present. Results generally show that the ML model is properly trained and applied.	Some predictions or evaluation results are produced, but significant errors are found. Some performance metrics are present but generally not trustworthy.	Predictions and evaluation results are missing or largely incomplete. No meaningful results are produced within the submitted work.
Demonstration of Understanding (30%)	A thorough understanding of the application (on what, why, and how) is demonstrated through the written report, demo, and presentations.	The submitted work demonstrates a reasonable grasp of the workflow. Some evidence of understanding is present.	The project is unorganized and difficult to follow with little evidence that the student understands the overall workflow.	The project is unorganized, incomplete, or missing. Nearly no evidence is present that demonstrates the student's understanding.
Remarks on Final Report, Demo, Code, and Presentations	The final report is well written and organized. The submitted demo clearly shows and explains an operational application. The code is clear and runs bug-free. The presentations are well prepared and interesting to the audience. Both presentations are well given.	The final report is mostly well written and fairly organized. The submitted demo showcases a working application. The code is fairly organized. Both the proposal and final presentations are well given.	The report and demo might contain some errors. There are missing components in the submitted work, but the overall approach is valid and can be followed. Limited understanding is demonstrated through the presentations.	The report, demo, and code contain significant errors or missing components. Limited understanding is demonstrated through the presentations. The presentations are unorganized or the student has failed to present.
